The primary goal of AutoCAD is to automate the drafting process, allowing a user to move, zoom, rotate, scale, and align geometry. At its most basic level, AutoCAD allows users to lay out the basic parts of a construction project, such as walls, doors, beams, and framing; then, the user can create an assembly plan that arranges and positions those components in a logical way

Field of the Invention The present invention relates to solar heating systems, and more particularly, to a solar collector apparatus having a pair of intersecting reflectors attached to a sun tracking mechanism which allow for tracking of the sun and for reflecting all or a portion of the sun's rays to a trough filled with heat transfer fluid. 2. Description of the Related Art Typically, the prior art teaches the use of a relatively complex sun tracking system that uses a telescope or similar arrangement to track the sun's movement. These prior art systems typically include a motorized mechanism that uses a motor to effect the rotation of a telescope or other device. These prior art systems require a relatively complicated drive mechanism, such as a motor, gears, belts and related mechanical components that are subject to failure. Additionally, these prior art systems do not provide for precision tracking, and are not able to quickly and accurately track the sun. Additionally,

the prior art typically teaches the use of reflecting surfaces that have a relatively small reflecting area and/or that operate only when the sun is directly overhead. As such, these prior art solar collector systems are not able to collect all of the sun's rays and are not able to be efficiently utilized when the sun is not directly overhead. What is needed is a solar collector that does not require a complicated and expensive tracking mechanism, and is able to quickly and accurately track the sun. Additionally, a solar collector that can utilize any location on a roof is needed, regardless of whether or not the sun is directly overhead.Q: Java: Asynchronous vs Synchronous It seems java is asynchronous and can be run in parallel by multiple threads or in a sequence by the threads that are available at the time the method is invoked. I wanted to know in general, how a java method is run on a computer. Does it run in series or in parallel? A: Java is a "procedural" language. That is, the

Serum and cellular phosphatidylserine (PS) levels of SARS-CoV patients were analyzed. PS increased markedly in SARS-CoV-infected patients, which was the most evident in the first week. This phenomenon was also observed in patients with dengue virus, which has been proven to be closely related to SARS-CoV. Our findings indicate that PS may act as an antiviral agent against SARS-CoV.Q: Windows Java Server SystemProperty is different from.bat/cmd I have created a task for install java JRE and JDK to work on Windows Server. I write this in a.bat file: java -jar c:\path\to\jre\jdk8u171_windows-x64_bin. For example: On PC A: System.getProperty("java.home") >> "C:\Program Files\Java\jdk1.8.0_171" On PC B: java -version java version "1.8.0_171" Java(TM) SE Runtime Environment (build 1.8.0_171-b11) Java HotSpot(TM) 64-Bit Server VM (build 25.171-b11, mixed mode) In fact, I don't know how the system identify java environment, but it seems different. Anyone can help me? A: When you transfer your.bat file to another computer, windows create a new environment variable
