Ashampoo Office 2007 v3.00.0.0 Full version plus activator.rarPaul Moore (newsreader) Paul Moore (born 22 March 1970) is a radio and television newsreader who has worked in the media for over 30 years. He is a native of Glasgow, Scotland, where he completed his National Diploma in Business Studies at Strathclyde University. He began his journalistic career as a reporter for the Glasgow Evening Times in 1990 before moving to WJRX in Detroit, Michigan and then to Radio One in London. He then joined the LBC radio station and in 2004, he joined BBC Radio 5 Live to present the drive time news programme "Radio 5 Live News". Moore joined BBC London 94.9 in 2007 where he was the main newsreader for the station's breakfast show, Dermot Murnaghan's Mornings with Dermot. Paul Moore announced in December 2008 that he was leaving the BBC to concentrate on his work as a radio presenter and will be based in the US. References Category:Living people Category:Radio people from Glasgow Category:Alumni of the University of Strathclyde Category:1970 births Category:BBC newsreaders and journalists Category:Scottish radio presenters Category:Scottish expatriates in the United StatesThe present invention relates to a method for manufacturing a fine line width semiconductor device and to a fine line width semiconductor device. In recent years, the reduction in the size of a semiconductor integrated circuit device has been accompanied by the use of a fine line width technique for forming an interconnection and opening for contact. In the manufacture of a semiconductor integrated circuit device using a fine line width technique, it is necessary to remove resist and the like. It is, therefore, important to obtain a superior removal rate, a superior flatness, and a reduced peel of the resist. In a chemical reaction removal method, a process for removing a resist and the like without damaging the semiconductor substrate is required. An example of a conventional technique for removing a resist while suppressing damage to a semiconductor substrate is as follows. First, a resist is formed on a semiconductor substrate. Next, a thin film is formed on the resist. Then, the thin film is etched using the resist as a mask to form a resist removal opening having a margin on the semiconductor substrate. Next, the resist is removed with a chemical solution

With CrackQ: Is it possible to pass angular object to local variable? i'm looking for a solution to pass an object to a local variable. My problem is: i've inherited an angular app and am adding some things to an angular component. Since the component isn't not created at the time of this app i don't have access to the angular app's data. Is there a solution to do something like this: to be able to get the id property from the parent object. A: Instead of trying to access the parent object from inside the component, I think you could set up an ngZone.run so that any changes to the component are visible and allow you to reference the parent object. As @Porper says, some components should only be instantiated when needed. I assume the above example is something like the following: @Component({ selector:'my-component', template: `` }) export class MyComponent { constructor(private zone:NgZone) { //inject parent object as provider //this gives you access to the angular zone, //so you can call \_zone.run this.\_zone.run(() => { this.contact = {id:123}; }); } } If the parent object is a service, you could inject it using the @Inject decorator. If the parent object is an array, to get a reference to the id of the element that has changed you can use the following: //this will run when the element (i.e., the object with the id property changed) //is first rendered in your view: this.zone.run(() => { this.contacts[\$('.my-component')[0].id].id = 456; });

There, the result must be this: [root@moz ~]# sed -r '/^.\*(0[0-9].\*[0-9][0-9][0-9][0-9][0-9]:[0-5][0-9][01][0-9]:[0-5][0-9]|2[0-4][0-9]:[0-5][0-9][01]\d:[0-5][0-9]|16[0-4]:[0-5][0-9][12][0-9]:[0-5][0-9]|([12][0-9]|3[01][0-9]|31)[0-5][0-9][0-9]:[0-5][0-9]|([0-9]|11)[0-5][0-9]|1-4[0-9]:[0-5][0-9]|0-1[0-9]:[0-5][0-9]|12:00|14:00|17:00|18:00|19:00|20:00|21:00|22:00|23:00|24:00|([0-9][0-9]:[0-5][0-9][0-9]:[0-5][0-9]|00:00))\$/p' result My final goal is to get the stored value in a file. A: As the fixed regex in Python is so long, and it could possibly go wrong, I would suggest to use sed. To match 10:15:00 with exact time, use the following regex: ([0-9][0-9]\.[0-9][0-9]:\d|10\15\00)\$ The \$ tells sed not to backtrack after matching, but it still can backtrack while searching the pattern. The replacement part is done like this: ( stores captured group 1 (there is only one in this case, which is \$1) into \$1 | alternates with [0-9]
