I'm using a shared wifi hotspot at an institute, and I need to download the drivers (but I can't use my Internet) to be able to use my internet for almost 4 hours and use the Internet safely throughout the day (since it's for school work). Is there a way to download the drivers offline, in order to use them offline? What is the best idea? How can I download all the drivers? Are there any hacking programs that download drivers? P.S. I'm using Windows 7 Home Premium, 64 bit.

Thank you in advance, G. A: You can download the drivers and then install them. However, this will install the drivers for all the network interfaces that are configured in your system, not just the one you need. Also, this is not practical in this case - you need to be online for the drivers to update. Otherwise, you can use a software for network sharing called UPnP. Although this will only allow you to download the drivers you need. The software should work on Windows 7 and above.
