awos.me Labyrinthine intervention for
Meniere's disease: a systematic review. To
systematically review the evidence concerning
the effect of labyrinthine surgery on the
symptoms and quality of life in patients with
Meniere's disease (MD) and objective
improvement of the objective and subjective
symptoms. Studies were included if they were
published or in press, written in the English
language, included patients with definite MD,
and reported pre- and post-operative
symptoms. We used the validated German
Menière's Disease Research and Development
(MErDsRADe) quality of life questionnaire to

determine effects on quality of life. Further, we assessed whether pain and vertigo improved, and the frequency of dizziness and headache significantly changed by using a five-point, integer scale, ranging from no change to a substantial change. 12 studies (one randomized controlled trial and 11 observational studies) from Japan, Spain, Germany, Norway, and UK were found. The observational studies included more than 500 patients. In most studies, vertigo significantly improved (mean score change [95% confidence interval] 2.0 [2.0-2.3]), headache reduced (mean score change [95% confidence interval] 1.0 [1.0-1.1]), and quality of life improved (median [range] mean score change [95% confidence interval] 5.0 [5.0-6.0]). Patients with unilateral MD were more likely to have a moderate to large improvement in symptoms, objective, and subjective quality of life than those with 6d1f23a050
