ABOVE: L.A. Kingshockey captain Dustin Brown, on the bench, prepares for puck-drop. **BELOW:** An iPad Pro surface. The illustrations in this review were conceived on the iPhone 6S Plus. How do you design a camera, or a display, or a CPU? Not much different than how you design software. There will be a checklist of items that must be complete in order to make a good product. For camera, the checklist will be things like exposure, quality of the image produced, possibly focus, color, etc. For software, it will likely be things like performance, stability, quality of interfaces, quality of documentation, etc. Indeed, if there is a camera, there will be a checklist. But there should probably also be an expectation from the people who buy the product, that those products are used. And it's the end user that Adobe should be catering too. Otherwise, it will fail in the marketplace. Capture an airport, then store it in a database? That's extremely exciting to me. It's an opportunity to create new databases using the computer. But you need to seed the databases with photos in order to learn the relationships between images. That means you need to be able to make a good raw photo. Creative Cloud has also opened up a lot of doors for photographers who aren't yet ready to quit. The ability to customize the way you take in shots matters a lot when you are creating (or just trying) to get the perfect shot. To convert RAW images, there is an Adobe® DNG Converter that works with all DIGITAL R NATIVE RAW (DNG) files and Adobe Photoshop 32, which means it can't just convert Photoshop files. I heard it can't yet convert RAW files in Lightroom (and the Digital Negative Format is quite complex). If you use Lightroom 3.6.1 and use presets from Photoshop X you also will find it difficult to get your photos into Placeholders (from Lightroom 3.5) until Lightroom 5 is released. Anyway, Lightroom's Placeholders feature is also quite handy. Ultimately, I think Creative Cloud is mainly useful if you are serious about your workflow and want to save disk space (SSD is still a bit pricey for those on a budget).

In the eye dropper menu, you can choose the colors you want in your final color and then just paint the areas you want healed. With the Paths folder, add a line with that will go through the centre of your image and the Paths create Group. Then select the Line or polygon tool with the Direct Selection tool. Press the Alt/Option key to select the start and end points of the line and adjust the line's size. Now, place the line on the canvas. Next, click multiple times on your canvas to add multiple paths. For more tips on drawing, click on the guidelines icon to show or hide a regular dotted line or clicking on the dotted line allows you to change the size of the path.
